EXPERIENCE

Software Engineer II *Aug 2024 – Present*
Brightline Health (telehealth clinics)

- Rebuilt Brightline's patient booking portal (>600K visits/month) in **React/TypeScript** with heads of Product and Design as a personalized feed of care tasks; A/B tested, then shipped to all patients with >80% positive ratings
- Built an end-to-end **AI agent** workflow that turns Figma designs into intake-form schemas, field documentation, and matching API types; adopted across Brightline's product teams to standardize contributions
- Added self-serve scheduling to Brightline's clinic platform through a Node.js/GraphQL service (~2M req/day), enabling clinic managers to change hours and visit types in **~2 minutes, replacing a next-day engineering release**
- Deployed new microservices on Brightline's AWS **Kubernetes** platform: set up API gateway routes and monitoring (Grafana dashboards, metrics, logs, alerts); created runbooks and provide on-call support
- Designed and built slot holds in the shared booking service with Redis locks, aligning three teams on a reservation API and fixing a race condition that double-booked providers; supports a projected $1.2M in visits

Software/ML Engineer, Northgate-Sponsored Capstone *Jan 2024 – Jun 2024*
Northgate Aerospace

- Built a real-time wildfire-detection system for Northgate Aerospace: ingests live satellite thermal feeds over California (900+ frames/min), scores each frame in ~40 ms, and flags new fires on a map for understaffed dispatchers
- Trained its PyTorch U-Net (**94.2%** recall) and added Grad-CAM heatmaps of why each region was flagged; won **1st place** of 60 teams at the Pacific State senior showcase and presented to Northgate's engineering directors

Software Engineer Intern *Jun 2023 – Aug 2023*
Cartwheel Payments

- Rebuilt Cartwheel's payout-investigation tool solo with FastAPI and a **Python** ETL job that syncs 8M+ bank records nightly; ticket resolution time fell 60%, and company-wide support onboarding links to it

Software Engineer Intern *Jun 2022 – Aug 2022*
Lumen Learning (Bay Area edtech startup)

- Built the frontend for a responsive study-planner web client with CRUD workflows and REST API integration

OPEN SOURCE & PROJECTS

TrailMix · trailmix.example.com
Co-founder & Software Engineer · React Native, Node.js, PostgreSQL

- Co-founded TrailMix, a mobile safety app for backcountry hikers (offline maps, closure alerts, trip check-ins); led engineering and one intern to **12K monthly users** in five months
- Built it full stack: an offline-first sync engine with conflict resolution, a multi-tenant Postgres backend with PostGIS search, and signed iOS and Android builds through a GitHub Actions CI/CD pipeline

SiteForge
Open-source static-site generator · Rust, Python

- Merged **Rust** concurrency fixes to SiteForge's incremental build cache (a data race, a use-after-free in unsafe code), with Python regression suites verified under Miri and ThreadSanitizer

Queryline · queryline.example.com
Python/FastAPI, React/TypeScript, PostgreSQL/pgvector

- Built a searchable knowledge base that answers from internal wikis for AI agents: hybrid search combining pgvector embeddings and BM25 keyword ranking, with an MCP server for search and versioned writes

EDUCATION

Pacific State University *Jun 2024*
B.S. Computer Science · GPA 3.6/4.0

SKILLS

Languages: TypeScript, JavaScript, Python, Rust, SQL

Tools: React, Node.js, GraphQL, FastAPI, Kubernetes, Docker, PostgreSQL, Redis, Grafana, CI/CD, Git
