EXPERIENCE

Software Engineer *Aug 2024 – Present*
Brightline Health

- Rebuilt the patient appointment-booking flow (~250K bookings/month) in **React/TypeScript** with the Product and Design leads; abandoned bookings fell from 31% to 19% in an A/B test
- Built the Node.js/GraphQL service that lets clinic staff change their schedules (~2M requests/day), so a schedule change takes **~2 minutes instead of a support ticket and a next-day release**
- Built an end-to-end AI agent workflow that turns design mockups into form schemas, field docs and API types; adopted by three product teams as the standard way to add a booking form
- Took both booking services to production on the company's **Kubernetes** platform: gateway routes, Grafana dashboards, logs and alerts, plus runbooks so any on-call engineer can fix an outage
- Fixed a time-zone bug that showed patients appointment slots that no longer existed, adding regression tests for daylight-saving changes; double-booking support tickets dropped from ~40 a week to 2

Research Assistant, Autonomy Lab *Sep 2023 – May 2024*
Pacific State University

- Built a ROS 2 logging pipeline in **Python** that records a campus delivery robot's camera, lidar and GPS streams, so the lab could replay and label 300+ hours of runs instead of re-driving routes
- Wrote a **C++** node that flags dropped sensor frames live; found and fixed a timestamp bug that had corrupted 12% of recorded runs, and the lab's mapping paper used the cleaned data

Software Engineer Intern *Jun 2023 – Aug 2023*
Cartwheel Payments

- Built an internal Python tool that matches failed merchant payouts to bank error codes; the support team used it daily to answer payout tickets in minutes instead of hours

Software Engineer Intern *Jun 2022 – Aug 2022*
Lumen Learning Labs

- Added automated accessibility checks to the shared React component library's CI, catching 140+ contrast and labeling bugs before release so the student app passed its WCAG AA audit

OPEN SOURCE & PROJECTS

TrailMix · trailmix.example.com
Founder & Software Engineer · React Native, Node.js, PostgreSQL

- Built and launched a trail-conditions app where hikers post closures and mud reports; grew it to **1,200 monthly users** in four months through two local hiking clubs
- Built it full stack: a React Native client that caches reports so hikers can read them with no signal, and a Node.js API on PostgreSQL with PostGIS search for trails near you

Open-source static-site generator
Contributor · Rust

- Merged a **Rust** caching fix to a static-site generator (2K GitHub stars) that skips unchanged pages on rebuild, cutting build time for a 5,000-page benchmark site from 41 s to 24 s

EDUCATION

Pacific State University *Jun 2024*
B.S. Computer Science · GPA 3.6/4.0

SKILLS

Languages: TypeScript, JavaScript, Python, C++, Rust, SQL

Tools: React, React Native, Node.js, GraphQL, PostgreSQL, Kubernetes, Docker, Grafana, ROS 2, CI/CD, Git
